

ABSTRACT

An apparatus that removably connects an AA or AAA-size flashlight
conjoined with a reflective device that can be removably attached to a retractable
5 leash, or any other device, or the forearm of a person using a standard non-
retractable leash. The apparatus has a loop section, and long and short
members of primarily elastic material with Velcro™ hook and loop type fasteners
positioned at either end. The loop section is a receiving area for a flashlight and
is integrated within the long and short members. The long and short members
10 and loop section have a reflective property. The long and short members wrap
completely around the vertical mid-section of the retractable leash. The
reflective quality of the device combined with use of a flashlight allows the
person walking a dog to become more visible to others in the absence of
ambient light, as well as, providing increased visibility by the individual person.
